

Mobile Data Technology for Medicare Health Risk Assessment

A Case Study In **Healthcare**

Signify Health (formerly CenseoHealth), the Texas-based business, performs countless tasks aimed at one common goal—enhancing customer wellness. The company’s nationwide network of nearly 5,000 contracted physicians performs comprehensive, Annual Wellness Visit-compliant health assessments with members in their homes, at network physician offices, and in community settings. Signify Health physicians require reliable, consistent data connectivity to ensure the real-time submission of patient health information to the central office through the use of a custom mobile app specifically developed to support the growing need for remote care.

With services that involve visiting patients’ homes, the investment in dependable data mobility is critical for fulfilling the business objectives of Signify Health. Joshua Anzaldua, Signify Health IT Manager explains, “We needed dependable wireless connectivity to perform important submissions of health record updates to our central office and book travel for our service providers.”

DataXoom provided Signify Health with LTE wireless to maximize data mobility and boast productivity levels among its staff. “What made DataXoom so appealing was the versatility and ability to mold things around the way we do business,” stated Joshua Anzaldua.
