

The 7 KPIs for ROI from IT

How to ensure your business's budget for IT is an investment, vs. an expense

In the 23 years we've been looking after organizations, we've noticed there are two different ways that owners and managers buy IT and technology.

Too often engaging with the first group never ends well!

Don't get us wrong; all businesses have moments where every last penny counts. That's fine in the short-term.

The problem is when that becomes the long-term driver of the business, and all spending decisions are made by asking "what's the cheapest way to do this".

We have greater success with the second group of people. Most of our existing clients fit into this category.

This second group recognizes that IT is their infrastructure; the backbone to their business. And they don't want to take any risks on the quality or security.

No matter what kind of organization you run, technology sits at the heart of it today. And it's going to become more and more important in the future.

Big thinkers see IT as a long-term investment. They understand the link between the short-term impact to cash flow, and the enormous

long-term benefits of business growth, increased productivity and highly satisfied staff and customers.

If you're nodding your head and agree with what we've just written, we really should talk – our organizations sound like a good fit.

However, before you pick up the phone, here's something else to think about.

Just because our clients are big thinkers and are willing to invest doesn't mean we don't focus very hard on giving them an excellent ROI – **Return On Investment**.

It's a big thing for us when doing our technology planning and regular strategic reviews with clients.

You've heard the saying "you can't manage what you can't measure". So here are 7 technology KPIs – Key Performance Indicators – that you could use to ensure you're getting your return.

Disclaimer: We don't necessarily use all of these KPIs with every client. We work with each client individually to understand what kind of reporting is most important to them. And then deliver that. There's no point doing reporting unless it's actually being used to make good strategic decisions.

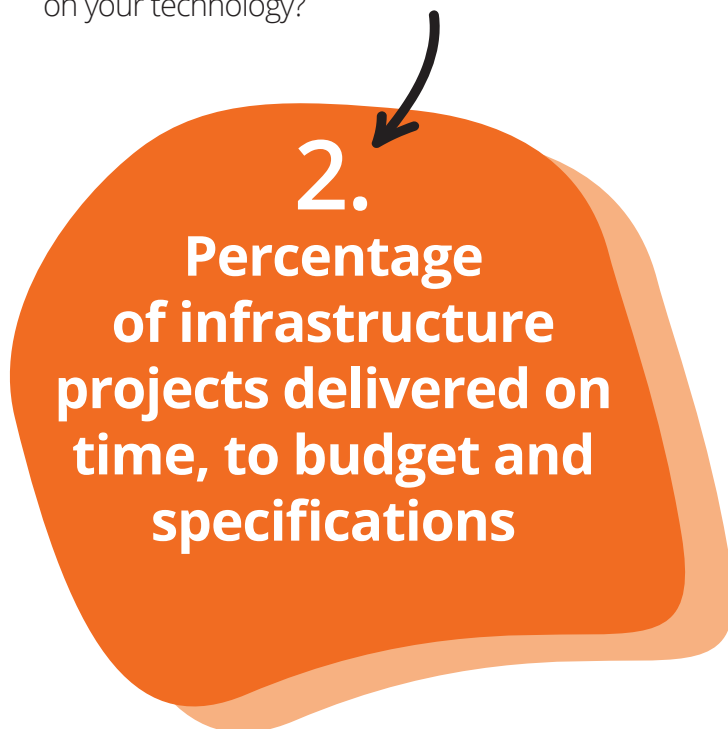

It's possible to forecast the costs of technology, and reduce the chances of "urgent, emergency spend".

You have to do this over the long-term. Accurate forecasts come from investing in quality infrastructure that's designed to accelerate growth and never hold it back.

This is why you need a technology partner who's deeply involved with your organization and its long-term planning. If someone doesn't understand where you're going and why, how can they accurately advise on your technology?

**1.
Budgeted IT
vs actual**

**2.
Percentage
of infrastructure
projects delivered on
time, to budget and
specifications**

This is an easy KPI to both understand and measure.

By tracking this, you encourage your IT partner to make realistic estimates about the length and cost of projects. Experienced IT professionals will not find it difficult to build in extra time and cost to account for foreseeable problems.

The 7 KPIs for ROI from IT

How to ensure your business's spend on IT is an investment, and never an expense

It's a common question most IT support companies get while talking to prospective new clients: *How long will it take to solve problems?*

The answer is "it depends". We mean, it depends on the problem and the impact of it.

All IT companies run a form of triage for problems that come in, just as emergency room doctors do in hospitals.

You wouldn't expect a broken arm to get the same amount of urgency and attention as a heart attack, because resources aren't unlimited.

It's the same with technology issues.

What's important is your IT partner understanding which of your systems are critical to normal operations, and what's just annoying when it doesn't work properly for a short while.

These boundaries should be established during onboarding with your new IT partner.

Downtime is when systems and devices are not available for your team to do their usual work.

There are two types of downtime – planned and unexpected.

The 7 KPIs for ROI from IT

How to ensure your business's spend on IT is an investment, and never an expense

A good IT partner will work with you to make sure that planned downtime for maintenance has as little impact as possible on your staff and overall productivity.

Of course, it's impossible to eliminate all unexpected downtime. Some of it is unavoidable, such as a loss of commercial power supply and loss of internet access in the wider area, not just your office.

Uptime is all the rest of the time when your systems are working fine.

Whoa! We just hit you with some technical terms. Here's what they mean.

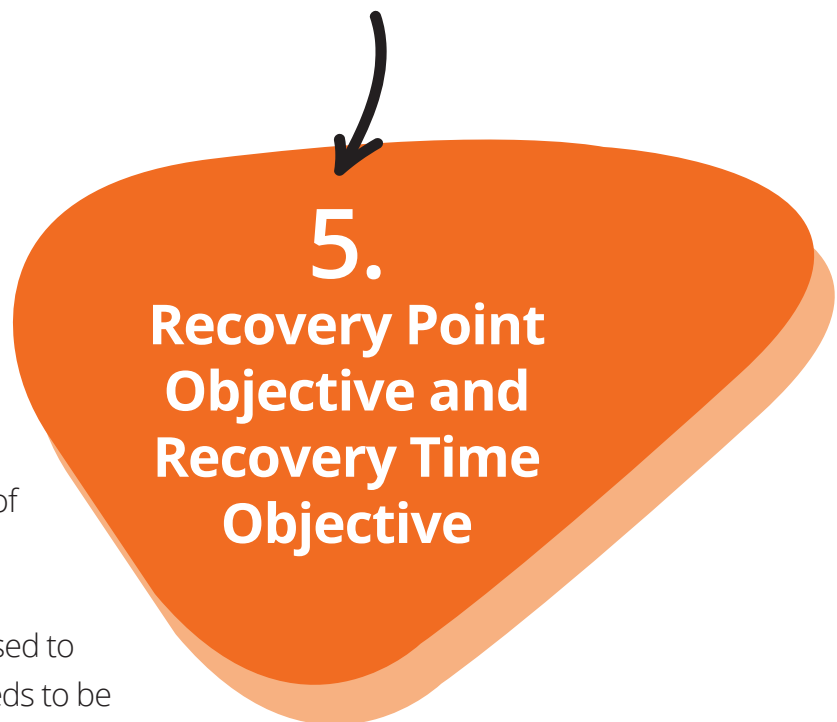

They're both about the backing up of your data.

Recovery Point Objective (RPO) is used to determine how often your data needs to be backed up. This will depend on how often it changes and how critical the data is.

For example, if you were a bank, you'd want an RPO of 0 minutes. If a bank's systems crash, they need to be able to recover every single transaction that happened right up to the point of the crash.

But let's say you ran an architects' office. Your staff might only save a few files a day. So, an RPO of 20 minutes might be acceptable. It means in the event of a big crash, the worst amount of data that can be lost is 20 minutes' worth.

Setting an RPO is always a trade-off between cost and convenience. There are always clever solutions a good IT partner can create for you – for example backing everything up in real time within your

office, then only sending it to a secure data center away from your office on a schedule.

Recovery Time Objective (RTO) is the length of downtime your business can tolerate until data recovery. Put another way, it's how long you realistically have to restore full operations.

Again, your critical systems will have a lower RTO than other systems. This is an important conversation to have with your IT partner.

Mean Time Between Failures (MTBF) is the average time between system breakdowns.

Knowing this can help you measure the performance and reliability of your infrastructure.

Tracking it can give you a real life view of how robust your systems are. Your staff may perceive there are "always problems", but measuring the MTBF might show your systems are running as expected.

This also works the other way round, when you discover you're suffering more failures than would be expected. This can help you build a business case for making an investment in new software, hardware, or systems.

The 7 KPIs for ROI from IT

How to ensure your business's spend on IT is an investment, and never an expense

This final KPI, Mean Time To Recovery (MTTR) measures the average time it takes your business to recover from a failure: From discovery to fix.

It's the average time it takes your business to get back up and running again.

This can also be a useful measure of how robust your business's infrastructure is, and help you decide where to invest long-term.

Of course, there are other KPIs that you could measure to look even more deeply into your IT systems. But these are the ones we recommend starting with.

Not only will they give you insight into how well your current infrastructure is working for you, but they will also tell you a lot about how well your IT provider is performing.

Would you like help
figuring out the right
technology KPIs for
your business and
measuring them?

**We can help.
Let's talk.**
