

PRIVACY HARDWOOD UNDERLAYMENT

PHWU has the correct density to absorb footstep noise under traditional hardwood floors.

Simple to install loose laid on any subfloor.

Available Fabric Facing for Glue Down Applications

Footstep noise (vibration) is transmitted through the finished floor into the structure below and heard downstairs. Traditional hardwood floors are notoriously loud in the rooms below. Privacy Hardwood Underlay™ is a uniquely engineered product that will absorb footstep noise when used under traditional nail down hardwood floors.

Privacy Hardwood Underlay™ is a locally reactive floor soundproofing product; it absorbs the vibration caused when footsteps occur, at the source. Footstep vibration is significantly reduced before it travels into the structure. Utilizing a soundproofing underlay when installing your floor will create far quieter rooms below in your home or office.

Privacy Hardwood Underlay™ is installed loosely laid, wall to wall, with no gaps. First, install our perimeter isolation gasket to prevent hard connections to walls, cut PHWU to size, tape all seams with our metal tape, and install your finished hardwood floor. Leave a typical gap at the perimeter of the wood floor for expansion, and install your baseboard.

We carry soundproofing underlayments for specific floor types; one-size-fits-all does not apply when soundproofing a floor. You need the right product from the right company to be sure your project will be successful!

PHWU under nail down hardwood floors to reduce footstep noise to the rooms below. At only 1/8" thick PHWU will not affect transitions.
