

5 CLOUD SOLUTIONS EVERY BUSINESS SHOULD HAVE

It's almost impossible to run a business today without using some type of cloud technology. But despite its pervasiveness, many business owners are unsure about which solutions will benefit their organization most. In our experience, there are five categories you should focus on first.

FILE STORAGE

Storing company files in the cloud is a great way to give employees more mobility and flexibility. Everyone can access information from almost any internet-enabled device without compromising security, since providers include things like encryption and multifactor authentication as part of the monthly service fee.

EMAIL

Opting for cloud-based email means you pay for the service without worrying about hardware requirements or software updates. These issues, among others, will be handled by your Managed Services Provider.

DOCUMENT CREATION & COLLABORATION

What sets this apart from cloud storage is the ability that in most cases, multiple users can alter the same document simultaneously and see mirror images on their screens even if they're hundreds of miles apart.

SERVER HOSTING

Server hosting enables you to accomplish via an app all that you could with in-house hardware. The costs are also spread out month to month rather than all at once during the setup phase.

BACKUP & RECOVERY

The entire basis of cloud technology is that you have total access to hardware and software that's located far from your office. That makes things like cloud file storage and server hosting perfect for recovering from a disaster. If a natural disaster or cyberattack renders your office inoperable, all you need to do is log into your cloud platform from somewhere else.
