

Creating & Managing Strong Password Tips

When it comes to online security, a strong password is essential, and you should use a different one for each of your accounts, services, and apps.

- **Use a unique password for each of your accounts.**
- **Make your password at least 12 characters long and use a combination of uppercase and lowercase letters, numbers, and special characters.**
- **Avoid using personal information, such as your name or birthdate, in your password.**
- **Use a password manager to store and generate strong passwords for you.**
- **Enable two-factor authentication** whenever it is available.
- **Avoid sharing your password with anyone.**
- **Change your passwords regularly, at least every few months.**
- **Avoid using the same password for multiple accounts.**
If one account is compromised, all your accounts could be at risk.
