## The Modern Security Stack

In today's war against cybercrime, anti-virus software is not enough. You need a multi-dimensional, layered approach to security to protect your company's data.

### **Our Approach**

Here at AlphaNet, we have focused on a core set of vendors to provide our security platform. These are all significant vendors, focused on supporting companies like ours in supporting companies like yours. We evaluate our security stack every 6 months at a minimum, sometimes more often when something significant has happened in the area of cybersecurity.

To go over the modern security stack, we are grouping technologies into one of 6 areas of concern. We will explain the area of concern, then the specific technologies in that group. Note we will not be addressing specific products, but functionalities.

### **Tip of the Spear**

This group covers the heart of our protection, the endpoint security elements. These include:

**Anti-Virus/Anti-Malware/Anti-Ransomware**—The traditional first line of defense.

**Exploitation Mitigations**—these are defenses for known vulnerabilities.

**Privilege Access Management**—this allows us to have an admin user present on a PC only when it's needed. Most malware piggy backs off the security level the user has when doing their job, or elevate security. With this in place, this isn't possible.

### **Protecting the Perimeter**

This is the traditional firewall's domain. Today's technology makes an old-school firewall look like a horse and buggy. Items here include:

**Unified Threat Management (UTM) Appliance**—this is what has made the firewall a dinosaur. The UTM doesn't just grant or deny access, it follows the allowed resource around your network to make sure it doesn't mis-behave.

**Home Office Edge Appliance**—for a small or home office (less than 5 users), this appliance is an extension of your UTM, providing it's benefits without any extra management burden.

### **Head on a Swivel**

These technologies keep our end users alert and help reduce effectiveness of phishing attacks. This includes:

**Annual Cybersecurity Awareness Training**—this covers some regulated compliance requirements, such as most state's privacy laws. It is also often mandated by insurance companies these days.

**Weekly reminders to stay vigilant**—watch a quick video, answer some questions, don't get hacked!

**Simulated Phishing Attacks**—to keep your users on their toes.

**Dark Web Monitoring**—we monitor the Dark Web for any mention of credentials including your company's domain(s). If something shows up, we notify you and your effected end user so they can change their passwords.

**Employee Productivity Monitoring**—keep an eye on what your employees are doing, especially the remote ones.

### Lock It Up

What happens if your device falls into the wrong hands? Items here include:

**Multi-Factor Authentication (2FA or MFA)**—by adding this to any login you can, you dramatically reduce the chances of someone getting on your device or in your cloud app. We recommend this for Windows Login and Microsoft 365 at a minimum.

**Hard Drive Encryption**—by encrypting your hard drive, we prevent someone from getting around your password and MFA. It’s also seamless to your users, as the successful login unlocks the encryption.

### Keep an Eye on It

The price of security is vigilance. Items here include:

**Remote Monitoring & Management (RMM)**—this allows us to monitor your network, and address

issues.

**Secure Remote Control**—an extension of the RMM, this allows us to actually connect to your PC.

**Managed Detection & Response**—A third party Security Operations Center (SOC) is watching your network, determining if intrusions are individual and random or part of a concerted attack.

**Penetration Testing**—we periodically recommend having a third party perform a penetration test on your network.

### Back It Up

When things go wrong, nothing beats a good backup. We recommend 3 distinct backups:

**Backup of M365**

**Backup of Servers** to a local appliance and the cloud

**Backup of Critical Workstations**
